Can Reasoning Influence Perception?

Susanna Siegel
Edgar Pierce Professor of Philosophy
Harvard University

Normally, we have pretty good reason to believe our eyes. But there seem to be cases in which we reason our way to having some perceptions rather than others. Does the rational support provided by experience change, if our perceptual experience is influenced by expertise? What effects, if any, can background influences on perception have on the rational power of perception?

Susanna Siegel is Edgar Pierce Professor of Philosophy at Harvard University. She is the author of The Contents of Visual Experience (Oxford University Press, 2010), and many articles on topics in the philosophy of mind and epistemology.
